

Product Installation Instructions

Tier 2 Advanced Power Strip

To complete installation you will need:

- Tier 2 Advanced Power Strip (located in your kit)
- Any audio visual devices that are wasting power when they are not being used (TV or computer system are the most common)

Instructions

1. Unplug all existing equipment from the wall outlet or current power strip, and ensure each is in working order.
2. Determine any devices that require constant power such as timers, hard drives, cable boxes, DVR's or game consoles.
3. These devices should be plugged into the outlets on the Advanced Power Strip marked Always On.
4. Connect all other devices that can be power saved, such as TV's, DVD players, sound bars, amplifiers and stereos, to the outlets marked Power Saver on the Advanced Power Strip.
5. Next, firmly connect the SmartSensor cable to the side of the Advanced Power Strip. Make sure the SmartSensor cable is firmly connected to the Advanced Power Strip prior to plugging the Advanced Power Strip into the wall outlet.
6. Do not plug the Advanced Power Strip into an adapter or a power cord. Instead, plug the Advanced Power Strip directly into the wall outlet.
7. Place the SmartSensor in your line of site, and close to where you point your remote control.
8. Once the Advanced Power Strip has been plugged into the wall outlet, the SmartSensor will light up for three seconds to confirm your Advanced Power Strip is working. You can now use your remote to turn your system on or off, and be rest assured that the Advanced Power Strip is saving energy on those devices that are not being used.
